

1. Try to implement the following exception.

```
/* This is my Exception class, we have named it MyException
 * you can give any name, But it should
 * extend Exception class
 */
class MyException extends Exception{
    String str1;
    /* Constructor of custom exception class
     * here I am copying the message that we are passing while
     * throwing the exception to a string and then displaying
     * that string along with the message.
     */
    MyException(String str2) {
        str1=str2;
    }
    public String toString(){
        return ("MyException Occurred: "+str1) ;
    }
}
```

Write a code implementing this example exception. You need to throw this exception from main method of implementation class and also write a catch block inside main to handle this exception
